

NHS MEDICAL POLICY

Long Acting Lipoglycopeptide Antimicrobial Agents Medicine 2019-002

FDA approved alternative long-acting agents for the treatment of skin and soft tissue infections include Dalvance (dalbavancin), Orbactiv (oritavancin) and Vibativ (telavancin). One of these antibiotics may be indicated for use when ALL the following are present:

1	For Orbactiv (oritavancin) and Vibativ (telavancin): The member is an adult age 18 or over. For Dalvance (dalbavancin) only: The member is a child, 3 months of age or more, or an adult.
2	The member has an acute bacterial skin or skin structure infection requiring antibiotic therapy. For Vibativ (telavancin) only: This antibiotic may also be used for hospital-acquired or ventilator-associated pneumonia.
3	The member does NOT have osteomyelitis.
4	The bacterial pathogen is culture proven or strongly suspected to be gram-positive. Examples include methicillin-susceptible and methicillin-resistant <i>Staphylococcus aureus</i> , <i>Streptococci</i> or vancomycin-susceptible <i>Enterococcus faecalis</i> .
5	The provider has documented a clinical reason why the member cannot take an oral antibiotic. OR, the provider has documented why the member is not an appropriate clinical candidate for an oral antibiotic.
6	The member requires at least 7 days of parenteral antibiotic therapy.
7	The provider has documented a clinical reason why the member cannot take vancomycin, linezolid or another appropriate antibiotic. OR, the provider has documented why the member is not an appropriate clinical candidate for vancomycin, linezolid or another appropriate antibiotic.
8	For Orbactiv (oritavancin) only: The member does not take anticoagulant medication and does not require coagulation tests for at least 5 days following the planned administration of oritavancin. (Note: This antibiotic can prolong coagulation tests, such as PT, PTT or ACT.)
9	For Vibativ (telavancin) and Dalvance (dalbavancin): Dosing has been appropriately adjusted for any renal function impairment, if present.
